Normal `#raw()` works as expected:

```
/*
 * Example taken from
 * https://typst.app/docs/tutorial/formatting/
 */
#show "ArtosFlow": name => box[
#box(image(
"logo.svg",
height: 0.7em,
))
#name
]

// Long line that breaks
This report is embedded in the ArtosFlow project. ArtosFlow is a project of the
Artos Institute.

// Very long line without linebreak
This_report_is_embedded_in_the_ArtosFlow_project._ArtosFlow_is_a_project_of_the_Artos_Institute.

// End example
```

Using `#sourcecode()` will add line numbers and a frame. Very long lines will overflow.

```
1  /*
2   * Example taken from
3   * https://typst.app/docs/tutorial/formatting/
4   */
5  #show "ArtosFlow": name => box[
6    #box(image(
7      "logo.svg",
8      height: 0.7em,
9    ))
10   #name
11 ]
12
13 // Long line that breaks
14 This report is embedded in the ArtosFlow project. ArtosFlow is a project of
   the Artos Institute.
15
16 // Very long line without linebreak
17 This_report_is_embedded_in_the_ArtosFlow_project._ArtosFlow_is_a_project_of_the_Artos_Institu
18
19 // End example
```

Sourcecode can be loaded from a file and passed to `#sourcefile()`. Any CODELST sourcecode can be wrapped inside `#figure()` as expected.

CODELST blocks line numbers can be formatted via a `#show()` rules like:

```
show <line-number>: (n) => { ... }
```

To the right in Listing 1 you can see the `typst.toml` file of this package with some *fancy line numbers*.

```toml
[package]
name = "codelst"
version = "1.0.0"
entrypoint = "codelst.typ"
authors = ["Jonas Neugebauer"]
license = "MIT"
description = "A typst package to render sourcecode."
repository = "https://github.com/jneug/typst-codelst"
exclude = ["example.typ", "example.pdf", "manual.pdf", "manual.typ", "tbump.toml"]
```

Listing 1: typst.toml

Since packages can't `#read()` files from outside their own directory, you can alias `#sourcefile()` for a more convenient command:

```
let srcfile( filename, ..args ) = sourcefile(read(filename), file:filename, ..args)
```

Formatting is controlled through options. To use a default style, create an alias for your command:

```
let code = sourcecode.with(
numbers-style: (lno) => text(black, lno),
frame: none
)
```

`#sourcecode()` accepts a number of arguments to affect the output like *highlighting lines*, *restrict the line range* or *place labels* in specific lines to reference them later.

```
    #"hello world!" \
    #"\"hello\n  world\"!" \
    #"1 2 3".split() \
    #"1,2;3".split(regex("[,;]")) \
    #(regex("\d+") in "ten euros") \
    #(regex("\d+") in "10 euros")
```

To reference a line use `#lineref()`:

- See line 11 for an example of the `split()` function.

Long code breaks to new pages and line numbers should (for the most part) still stay aligned. To have listings in figures break, you need to allow it via a `#show()` rule:

```
#show figure.where(kind: raw): set block(breakable: true)
```

Listing 2: *Code of this example file.*

```
#import "./codelst.typ": sourcecode, sourcefile, lineref, code-frame

#let codelst = text(fill: rgb(254,48,147), smallcaps("codelst"))
#let cmd( name ) = text(fill: rgb(99, 170, 234), raw(block:false, sym.hash + name.text + sym.paren.l + sym.paren.r))

#let code-block = block.with(
  stroke: 1pt,
  inset: 0.65em,
  radius: 4pt
)

#let code-example = ```typ
/*
 * Example taken from
 * https://typst.app/docs/tutorial/formatting/
 */
#show "ArtosFlow": name => box[
  #box(image(
    "logo.svg",
    height: 0.7em,
  ))
  #name
]

// Long line that breaks
This report is embedded in the ArtosFlow project. ArtosFlow is a project of the Artos Institute.

// Very long line without linebreak
This_report_is_embedded_in_the_ArtosFlow_project._ArtosFlow_is_a_project_of_the_Artos_Institut

// End example
```

Normal #cmd[raw] works as expected:

#code-block(code-example)

Using #cmd[sourcecode] will add line numbers and a frame. Very long lines will overflow.

#code-block(sourcecode(code-example))

Sourcecode can be loaded from a file and passed to #cmd[sourcefile]. Any #codelst sourcecode can be wrapped inside #cmd[figure] as expected.

#codelst blocks line numbers can be formatted via a #cmd[show] rules like:

```typc
show <line-number>: (n) => { ... }
```

#code-block[
```
```

```
  #let filename = "typst.toml"
  #let number-format(n) = text(fill: blue, emph(n))

  #show figure.where(kind: raw): (fig) => grid(
    columns: (1fr, 2fr),
    gutter: .65em,
    [
      #set align(left)
      #set par(justify:true)
      To the right in @lst-sourcefile you can see the #raw(filename) file of
this package with some #number-format[fancy line numbers].
    ],
    fig
  )
  #show <line-number>: number-format

  #figure(
    caption: filename,
    sourcefile(
      numbers-side: right,
      file: filename,
      read(filename))
  )<lst-sourcefile>
]

Since packages can't #cmd[read] files from outside their own directory, you can
alias #cmd[sourcefile] for a more convenient command:

```typc
let srcfile( filename, ..args ) = sourcefile(read(filename),
file:filename, ..args)
```
#let srcfile(filename, ..args) = sourcefile(read(filename),
file:filename, ..args)

Formatting is controlled through options. To use a default style, create an
alias for your command:

```typc
let code = sourcecode.with(
  numbers-style: (lno) => text(black, lno),
  frame: none
)
```

#cmd[sourcecode] accepts a number of arguments to affect the output like
highlighting lines, _restrict the line range_ or _place labels_ in specific
lines to reference them later.
#code-block[
  #sourcecode(
    numbers-start: 9,
    highlighted: (14,),
    highlight-labels: true,
    highlight-color: rgb(250, 190, 144),
    gutter: 2em,
```

```
    label-regex: regex("<([a-z-]+)>"),
    frame: (code) => block(width:100%, fill: rgb(254, 249, 222), inset: 5pt, code)
  )[```typ
  #"hello world!" \
  #"\"hello\n  world\"!" \
  #"1 2 3".split() \ <split-example>
  #"1,2;3".split(regex("[,;]")) \
  #(regex("\d+") in "ten euros") \
  #(regex("\d+") in "10 euros")
  ```]
]

To reference a line use #cmd[lineref]:

- See #lineref(<split-example>) for an example of the `split()` function.

Long code breaks to new pages and line numbers should (for the most part) still stay aligned. To have listings in figures break, you need to allow it via a #cmd[show] rule:

```typ
#show figure.where(kind: raw): set block(breakable: true)
```
#[
  #show figure.where(kind: raw): set block(breakable: true)

  #show figure.where(kind: raw): (fig) => [
    #v(1em)
    #set align(center)
    #strong([#fig.supplement #fig.counter.display()]): #emph(fig.caption)
    #fig.body
  ]

  #figure(
    srcfile("example.typ", highlighted: range(121, 136), numbers-step: 5, numbers-first: 5),
    caption: "Code of this example file."
)
]

#pagebreak()
== More examples

And last but not least, some weird examples of stuff you can do with this package (example code taken from #link("https://github.com/rust-lang/rust-by-example/blob/master/src/fn.md", raw("rust-lang/rust-by-example"))):

#sourcecode(frame:none, numbering:none)[
  ```rust
// Unlike C/C++, there's no restriction on the order of function definitions
fn main() {
  // We can use this function here, and define it somewhere later
  fizzbuzz_to(100);
}
```

```
]

#sourcecode(
  numbering: "I",
  numbers-style: (lno) => align(right, [#text(eastern, emph(lno)) |]),
  gutter: 1em,
  tab-indent: 8,
  gobble: 1,
  showlines: true,
)[
  ```rust

    // Function that returns a boolean value
    fn is_divisible_by(lhs: u32, rhs: u32) -> bool {
        // Corner case, early return
        if rhs == 0 {
            return false;
        }

        // This is an expression, the `return` keyword is not necessary here
        lhs % rhs == 0
    }

  ```
]

#block(width:100%)[
  #sourcecode(
    numbers-width: -6mm,
    frame: block.with(width: 75%, fill:rgb("#b7d4cf"), inset:5mm)
)[```rust
  // Functions that "don't" return a value, actually return the unit type `()`
  fn fizzbuzz(n: u32) -> () {
      if is_divisible_by(n, 15) {
          println!("fizzbuzz");
      } else if is_divisible_by(n, 3) {
          println!("fizz");
      } else if is_divisible_by(n, 5) {
          println!("buzz");
      } else {
          println!("{}", n);
      }
  }
```]
  #place(top+right, block(width:23%)[
    #set par(justify:true)
    #lorem(40)
  ])
]

#sourcecode(
  numbering: "(1)",
```
```

```
    numbers-side: right,
    numbers-style: (lno) => text(1.5em, rgb(143, 254, 9), [#sym.arrow.l #lno]),

    frame: (code) => {
      set text(luma(245))
      code-frame(
        fill: luma(24),
        stroke: 4pt + rgb(143, 254, 9),
        radius: 0pt,
        inset: .65em,
        code
      )
    })[```rust
  // When a function returns `()`, the return type can be omitted from the
  // signature
  fn fizzbuzz_to(n: u32) {
      for n in 1..=n {
          fizzbuzz(n);
      }
  }
  ```]
```
```
